

A WORKED EXAMPLE, NOT A GENERIC PITCH

What an AI-powered CRM for a Tours & Travel business would look like.

Built on the same proven foundation as the CRM we run our own agency on — GST invoicing, quotations, client portal, AI — reworked for how a travel business actually sells: by itinerary, not by generic "deal."

Same proven engine, new workflow

GST for tour operators, done correctly

Package quoting with real margins

AI-drafted itinerary replies

WHY A GENERIC CRM (OR A GENERIC BUILD) FALLS SHORT HERE

Travel doesn't sell in a straight pipeline.

A generic "Lead → Deal → Won" CRM assumes one product, one price, one invoice. A travel enquiry is none of those.

Itinerary-based selling

One enquiry can turn into 3–4 competing itinerary options before a client picks one — a "deal" needs to hold multiple quoted versions, not just one price.

Cost vs. sell price

Every package has a vendor cost (hotel, transport, guide) hidden behind the client-facing price — margin visibility per package, not just total invoice value.

Group vs. solo travel

A single booking can be one traveler or a group of 20, each needing their own documents but one consolidated invoice and payment schedule.

Payment tied to travel date

Advance on booking, balance before departure — reminders need to run off the *travel* date, not the invoice date like a typical CRM assumes.

Tour-operator GST

Package/tour invoicing has its own valuation and documentation treatment, different from a straightforward service invoice — a generic invoice template gets this wrong.

WhatsApp-first enquiries

Most travel enquiries start as a WhatsApp message, not a form fill — the intake needs to meet clients there, the way this CRM already does for support tickets.

THE WORKFLOW, END TO END

Enquiry to traveler documents, in one system.

AI, in the same disciplined way

- Score enquiries by likely trip value and booking urgency — same pattern as lead scoring today
- Draft an itinerary reply from an enquiry's stated dates/budget/interests — human edits and sends
- Summarize a long back-and-forth with a client before a follow-up call

Operational features a travel business specifically needs

- Vendor/supplier ledger — track what's owed to hotels, transporters, guides per trip
- Seasonal demand view — which months/destinations are trending in enquiries
- Group booking roll-up — one invoice, many traveler records and documents

WHAT'S PROVEN VS. WHAT'S NEW WORK

Not a rebuild from zero — but not a copy-paste either.

Here's exactly what carries over from the system we already run our agency on, and what would be built fresh for travel.

Reused as-is (already battle-tested)

- GST invoicing engine — CGST/SGST/IGST auto-split, sequential legal numbering, GSTIN validation
- Partial/milestone payment tracking against an invoice
- Client portal architecture, role-based access, 2FA, audit logging, automated backups
- AI discipline: opt-in, wrapped in try/catch, never auto-sends
- Runs on the same low-cost shared hosting — no infra overhead

Built new for this vertical

- ✓ Itinerary/package data model (multiple options per enquiry, line-item vendor cost)
- ✓ Tour-operator-specific GST valuation and invoice format
- ✓ Traveler/group records distinct from the paying client
- ✓ Payment-schedule logic anchored to travel date, not invoice date
- ✓ Vendor/supplier ledger and seasonal demand reporting

WHY BUILD THIS WITH US SPECIFICALLY

You're not our first attempt at getting GST invoicing right.

"We built the GST engine this proposal reuses for our own agency's invoices first — 62 real GST invoices and 43 quotations have gone through it. That's the proof, not a claim."

Proven engineering, not a prototype

The billing/tax/portal core is live, tested (400+ automated tests) and running real client money today — that's the foundation your build starts from.

Cost-conscious by design

Shared hosting, plain MySQL, no Kubernetes or DevOps hire — a deliberate choice that keeps a travel business's running cost predictable.

We scope it honestly

Discovery first, a clear list of what's reused vs. newly built (see previous slide), and a milestone quote — like any other NEDS Software Development engagement.

NEXT STEP

Let's map your actual booking workflow.

A short discovery conversation — how enquiries come in today, how packages are priced, how payments are collected — is enough to turn this one-pager into a real scoped proposal with milestones and a quote.

Come prepared to discuss

- How enquiries arrive today (WhatsApp, website, phone, agents)
- Solo/FIT vs. group trip mix, and typical package value
- How payments and supplier costs are currently tracked
