

Support guide

You handle **tickets** (client issues) and **projects & tasks** (delivery work).

Your dashboard

- **Open tickets** — how many are active.
- **SLA at risk** — tickets due soon or already overdue.
- **Open tickets by priority** — urgent / high / normal / low.

1. Tickets

Tickets come from clients (via their portal) or are raised by staff.

Open a ticket to see the conversation. Each ticket has a **priority** and an **SLA due time** (when it should be resolved by) — urgent ones are due soonest.

Replying:

- Type in the reply box and send. A normal reply is **emailed to the client**.
- Tick **Internal note** to leave a note only staff can see (not emailed).
- If AI is enabled, **Draft with AI** writes a suggested reply from the

conversation — edit it before sending. **Summarize thread** gives you a quick recap of a long ticket.

Managing: use the panel to change **status**, **priority**, or **assignee**, attach files, and **Mark resolved** when done (the client is notified).

Filtering: use the filter bar to narrow by status, priority, or assignee.

Tick **SLA breached** (shown in red) to instantly see only the open tickets that have passed their SLA deadline — useful for prioritising your queue at the start of the day.

SLA breaches: when a ticket passes its SLA deadline, managers receive a one-time escalation email. The email shows how long overdue the ticket is (e.g. "1d 14h overdue"), the client, channel, priority, assignee, and a direct link to the ticket. No repeat emails — resolving the ticket is the way to clear it from the breach list.

2. Projects (Project Updates)

A **Project** is created from a won deal. Open **Project Updates** to see your projects, each with its client, service and tasks.

Posting updates to the client: each project has a **Notes & Client Updates**

section at the bottom. If you are **assigned to a project**, you will see the note form. Type a note — the **Visible to client** checkbox is ****ticked by default**** (shown in indigo when on). Keep it ticked so the update appears in the client's portal under "Updates from Our Team". Untick it only for internal notes that staff shouldn't share (e.g. hand-off notes). A "Visible to client" badge

marks shared notes in the list. If you do not see the note form on a project, you are not assigned to it — ask a manager to add you.

Editing or deleting a note: click **Edit** next to any note you wrote to correct it inline, or **Delete** to remove it. Managers can edit or delete any note; you can only edit/delete your own.

Note on client profiles: Support staff cannot add, edit, or delete contacts on a client profile — that is handled by the Sales team. You can view client and contact details but not change them.

WhatsApp tickets: if a client messages your WhatsApp support number, the CRM automatically creates a ticket with a green **WhatsApp** badge on the tickets list. Handle it like any other ticket — the client sees it in their portal too.

Drishti context link: if the ticket's client is connected to Drishti (nedsdrishti.in), a blue "**Open in Drishti** →" bar appears on the ticket page, just above the description. Click it to jump straight to the relevant Drishti view for that client — the link goes to the audit list for SEO/GMB tickets, the content/optimization view for Social Media/Ads tickets, or the client's general profile for other service types. This saves you from context-switching manually when the support query is about a delivered service.

3. Tasks (Employee Task)

Employee Task is your task list.

- Update a task's **status** (To-do → In progress → Review → Done) as you work.
- Tasks have a **due date**; overdue ones are flagged.
- Attach files to a task when needed.

Completing tasks on time feeds your performance report, so keep statuses current.

Scheduled maintenance tasks

At **8 AM every day**, the CRM automatically creates maintenance tasks for each active project you lead and assigns them to you with an ****in-app bell notification****. You do not need to remember these — just watch for the bell. Each task is already linked to the correct project and includes a description of what to do. Open it, complete the work, and mark it **Done**.

What fires and when:

Task	When
Website backup	1st and 15th of every month
Website malware / security scan	1st and 16th of every month
WordPress / CMS plugin updates	1st of every month
SSL certificate expiry check	1st of every month
Broken link check	1st of every month
GA4 / analytics review	1st of every month
AMC contract renewal review	1st of every month
Keyword ranking report	1st of every month
GMB profile health check	1st of every month
Social media account health check	1st of every month
Content calendar review	25th of every month
Website uptime & speed check	Every Monday
Google Search Console review	Every Monday
Google Ads performance review	Every Monday
Client portal contacts audit	1st of Jan, Apr, Jul, Oct

You only receive tasks for the services your projects actually run — a GMB project gets GMB tasks, a Website project gets website tasks, and so on.

If a task is missing: check that your project status is **Active** and that a service is set on the project. On-hold or completed projects do not get tasks.

4. Calls

Use  **Log a call** (top bar) or **Calling** to record calls you make to clients about their tickets or projects.

5. Notifications

The bell (🔔) in the top bar is how the CRM reaches you **without email**.

It fires when:

- A task is assigned to you (including the scheduled maintenance tasks above).
- A call follow-up you logged is due.

Click the bell to see all unread notifications with a direct link to the relevant task or ticket. Dismiss them once you've read them.

6. Morning digest email

At **9 AM** (Monday–Saturday) you'll receive a daily email listing your overdue tasks, tasks due today, and open tickets assigned to you — so you know exactly

where to focus before you open the CRM. No email is sent on Sundays.

Tips

- Always set the right **priority** on a ticket — it sets the SLA clock.
- Use **internal notes** for hand-offs between team members.
- Keep task statuses current — it feeds the performance report and the morning

digest accurately reflects what's still open.

- **Don't let maintenance tasks pile up as overdue** — they count against your on-time completion % in the performance report.
