

Manager — Recording Script

Audience: managers (watch [getting-started.md](#) first — includes 2FA setup, which is required for this role).

Target length: ~18 minutes (grown a lot with recent features — splits naturally after Scene 8, before the Team Nudges/Notice Board scenes, if that's more than you want in one take)

Before you record: have a client with multiple projects, a client flagged on Client Radar, an open ticket past SLA, a pending leave request, a Team Nudge you can create/edit, and (if set up) one content piece and one partner ready to point at. Log in as a manager user.

Scene 1 — Intro + company dashboard (0:00–1:00)

ON SCREEN: Manager dashboard — stat cards, services donut, task summary.

SAY: "This one's for managers. Unlike the operational roles, you see the whole business at a glance — total, active, and inactive clients with month-over-month change, a donut of projects by service line, and a task summary: assigned, pending, overdue, completed. From here you've also got quick links to Daily Reports and the Project Dashboard."

Scene 2 — Client Radar (1:00–2:15)

ON SCREEN: Sidebar → Client Radar, point at flag types, click ✨ Suggest action on a flagged client, then ✨ Draft recovery message on a Low Satisfaction flag.

SAY: "Client Radar is worth checking regularly. It flags active clients worth a proactive check-in — No Contact, if nobody's touched them in 14 days; Declining Activity; an Overdue Invoice; a Growth Opportunity, where they're only using one service even though more are active; and Low Satisfaction, if a client rated a resolved ticket 2 out of 5 or worse. Everything here is computed live, nothing's stored. Click 'Suggest action' on any flagged client and Claude drafts a specific next step from that client's actual flags. On a Low Satisfaction flag specifically, there's a second button — Draft recovery message — that writes an apology grounded in the actual ticket that was rated poorly. Review and personalize before sending either one; nothing goes out on its own."

Scene 3 — Employee Performance, Staff Ranking, and Revenue (2:15–4:25)

ON SCREEN: Dashboard → Reports → Employee Performance Report, pick a month, click ✨ Generate AI Summary, then point at the Score/Rank/Focus area columns further down and click ✨ Suggest Improvements for the Team, then Revenue Report.

SAY: "Two reports you'll use a lot. Employee Performance, per person for a chosen month — tasks completed, on-time percentage, calls made, leads converted, attendance percentage, daily reports submitted. Click Generate AI Summary and Claude turns those numbers into a narrative of trends and standouts — for a Sales rep with enough pipeline history, it'll name a specific stage where their deals move slower than the team average, not just a vague 'may need support' line. Below that, a ranked table scores and ranks each person only against their own role — Sales against Sales, Support against Support, and so on, since comparing across roles wouldn't mean anything — with a Focus area column showing their single weakest metric. A role with fewer than 2 people just shows 'not enough peers to compare' instead of a rank. Click 'Suggest Improvements for the Team' and Claude fills that Focus area column with a short, encouraging, specific suggestion per person. All of this — the AI summary, the ranking, the suggestions — is Admin/Manager only; it's never shown to the employee it's about, so treat it as a conversation starter, not something you hand them directly. Each employee does separately see their own rank and a tip on their own dashboard, just never anyone else's. Export the table to CSV for appraisals. Revenue Report, for a financial year — income by month, by service, by client, split recurring versus one-time."

Scene 4 — Lead sources, AI usage, and Ask the CRM (4:25–6:10)

ON SCREEN: Reports → Lead Source Performance, then AI Usage Report, then Ask the CRM — type a question and show the answer.

SAY: "Lead Source Performance shows conversion rate by source — website, WhatsApp, referral, cold call, phone enquiry, and so on — plus, for tracked website leads, a breakdown by ad campaign, so you know what's actually worth the spend. AI Usage Report tells you which of the CRM's AI features are actually getting used — calls, tokens, an estimated cost per feature, plus a Feedback column from anyone who's rated a draft helpful or not, so you can tell a feature that's used a lot but trusted poorly from one nobody's touched. And Ask the CRM is a plain-English question box — 'which clients are at risk this month', 'what's our win rate on SEO deals' — grounded entirely in the real figures from these reports, never invented. If it doesn't recognise your question, it lists what it can

currently answer instead of guessing, and every answer links back to the full report and shows the exact numbers it used."

Scene 5 — Sales Dashboard, company-wide (6:10–7:25)

ON SCREEN: Sidebar → Sales Dashboard → point at the rep leaderboard, then Save Targets form and a "Suggested: ₹..." hint.

SAY: "Sales Dashboard, company-wide for you — same KPI strip, trend chart, and needs-attention list as sales sees for their own deals, but unscoped. Two sections are yours specifically: a rep leaderboard — pipeline, won this month, target percent, win rate, average deal size, per Sales rep — and a Save Targets form where you set the company's monthly and financial-year target, plus each rep's own monthly target. Leave a field blank to leave it unchanged, it'll never zero one out on you. If there's enough recent history, you'll see a 'Suggested: ₹...' hint under a blank field — that's the trailing three months' average won value plus 10 percent — click it to fill the field, or just type your own number."

Scene 6 — Sales Incentive: setting the team pool (7:25–8:10)

ON SCREEN: Sidebar → Incentives → point at each rep's own tiered incentive, then the team bonus pool amount (editable) and the company target it's gated on.

SAY: "Sidebar → Incentives is also where you manage the team side of sales commission. Each rep sees their own monthly incentive live — a tiered rate on before-tax sales, 6% up to ₹50,000 rising to 20% above ₹2,50,000, marginal like income tax so there's never a reason to hold a deal back near a boundary. As Admin/Manager, you also set the team bonus pool amount here — a fixed rupee figure split evenly across active Sales staff, but it only pays out if the company hits the monthly target you set on the Sales Dashboard. On the 1st of each month, last month's numbers lock in as a final statement, so payroll has a stable figure even if a deal gets edited afterwards."

Scene 7 — Collections and Cash Forecast (8:10–9:25)

ON SCREEN: Sidebar → Collections, then Reports → Cash Forecast.

SAY: "Collections is the same client-by-client follow-up worklist accounts uses — who hasn't paid, what's partial, broken payment promises, and for milestone projects, whether the next milestone's ready to invoice. Filter by all clients, direct only, or one partner. Cash Forecast blends recurring revenue expected and receivables already due, bucketed by the next three months, with the open pipeline's weighted forecast shown

separately since it's indicative, not committed cash."

Scene 8 — Bell notifications and digests (9:25–10:25)

ON SCREEN: Bell icon.

SAY: "As a manager you're notified for a fair amount: any deal marked Won, company-wide; the same 7-day recurring-invoice-due warning accounts gets; a payment promise broken; a contract renewal coming due within 30 days; an SMDost brief approved and needing pricing; and any leave request submitted or reviewed. On top of the usual 9 AM morning digest, you also get a 9:15 AM Project Updates Digest — how many client updates were drafted and sent yesterday, which are still awaiting review after two-plus days, and any project that's gone quiet for five-plus days — and, every Monday at 9 AM, a weekly owner digest synthesizing pipeline, MRR, cash expected, and how many clients Client Radar has flagged, also as a Monday dashboard banner."

Scene 9 — Team Nudges: assigning trackable reminders (10:25–11:15)

ON SCREEN: Sidebar → Team Nudges → + New Nudge → fill title, target role, recurrence → Save. Then scroll to the team completion overview, point at a Pending, a Snoozed, and a Done row.

SAY: "Team Nudges is different from Notice Board, coming up next — a notice is a broadcast, a nudge is a targeted, trackable to-do. Sidebar → Team Nudges, New Nudge: a title, an optional description, who it's for — one role, or everyone — and whether it's one-time or weekly. Weekly nudges can also auto-clear on their own once the person does the real thing, like logging a Ticket, no click needed from them. Every targeted person sees it as a card on their own dashboard with Done and Snooze buttons. Down here, the team completion overview shows the real status for every nudge — Pending, Snoozed, or Done, plus how and when. Someone snoozing their own view never hides anything from you here — snoozed shows as its own status, it's never quietly folded into Done."

Scene 10 — Notice Board (11:15–11:50)

ON SCREEN: Sidebar → Notice Board → New Announcement → title, message, audience, pin checkbox.

SAY: "Notice Board, in the sidebar, is for posting time-bound company notices — office closures, holidays, policy changes — without relying on email or WhatsApp. Set a title, message, audience — Staff only, Clients only, or both — a start time, and an optional end time; leave the end date blank for a standing notice with no expiry, and tick Pin to top to keep an

important one above newer posts. A Staff/Both post shows as a dismissible banner at the top of everyone's Dashboard; a Clients/Both post shows the same way on the Client Portal home page. Nothing to manually take down — it stops showing once its end date passes."

Scene 11 — Oversight: who's working what, and Create Meeting (11:50–13:20)

ON SCREEN: Open a client → Services tab → point at the Team column.

Then Project Updates → toggle My Services. Then briefly point at the Create Meeting button on a client's Calls tab.

SAY: "You have access to every module for oversight — leads, deals, invoices, projects, tickets, all of it, and the search bar gets you anywhere fast. The fastest way to answer 'who handles GMB for this client' is opening their profile, Services tab — the Team column shows the lead and any other team members per project. And on Project Updates, there's a My Services toggle if you also run your own accounts, so you're not scrolling past everyone else's. One more thing worth knowing about even if you don't use it directly: once an admin's connected NEDS's Google account, everyone on the team can click 'Create Meeting' on a client or lead's Calls tab to schedule a real Meet call and email the client the invite — no personal Google account needed. Older calls can still be imported with recording and transcript, and an AI summary if enabled — useful context if you're catching up on a client you don't usually work with."

Scene 12 — Attendance, leave approvals, and daily reports (13:20–14:50)

ON SCREEN: Attendance → switch team member in the dropdown → Corrections → pick a date → update status/notes. Then Leave Requests → Review pending → approve one, pointing at its Type. Then Daily Reports → Team → point at a submission-streak badge.

SAY: "For attendance, switch between team members with the dropdown to see anyone's monthly record. If someone forgot to check in, go to Corrections, pick the date, and update their status and notes — the actual check-in and check-out times come from the employee's own action or the biometric machine and can't be edited here directly; corrections are logged to the audit trail either way. Leave Requests has a Review pending queue — you can't approve your own request, but any other admin or manager can. Watch the Type column: approving a Full Day request marks attendance as Leave for each office day in the range, but a Half Day request only marks that one day as Half Day, not a full day off. And on Daily Reports, the Team view shows everyone's submission for the day, with an X-out-of-7 badge per person so a chronic non-submitter stands out — red, amber, or green."

Scene 13 — Scheduled maintenance tasks (14:50–15:35)

ON SCREEN: Open a project with auto-created tasks.

SAY: "Every morning at 8 AM the CRM auto-creates maintenance tasks for each active project — backups, security scans, that kind of thing — assigned to the project lead. What you should watch: whether these are piling up overdue, since they count in the performance report, and that projects are marked Active with a service set, or they won't get any tasks at all."

Scene 14 — Content collaboration and partner health (15:35–16:50)

ON SCREEN: Sidebar → Partners → click a partner name → point at their collections/delivery table → then a project's Content Pieces card.

SAY: "If we're working with an outside content agency, that's the Content Collaboration module. Add the agency once under Partners, then on a project you can add content pieces — agency-led, where they create everything, or NEDS-led, where we write the copy first. Move each piece through its stages with the Move to button, and if you need the partner to send files back, generate a secure upload link — they don't need a CRM login at all. Click into a partner's own page and you'll see the same collections table filtered to just their clients — handy before a check-in call with them, so you can answer 'how are my clients doing' without digging. This is covered in a lot more depth in the written manager guide if you need the full workflow."

Scene 15 — Automated integrations, brief overview (16:50–17:35)

ON SCREEN: A client's Activity tab showing an automated event.

SAY: "Quick note on the automated side — when a deal is marked Won, the client gets set up in Drishti and SMDost automatically, no manual entry. Every one of these automated events leaves a trace on the client's Activity tab, so if something seems off, that's the first place to check. Full troubleshooting steps are in the Integrations guide."

Scene 16 — Wrap-up (17:35–18:05)

ON SCREEN: Dashboard, point at SLA-at-risk widget.

SAY: "Two habits worth building: check Client Radar and SLA-at-risk tickets regularly, and let the stagnation alert emails do the chasing for cold leads and deals — you don't need to track that manually. That covers the manager essentials."
