

SALES & MARKETING BRIEFING

The CRM we run our own agency on — now available for yours.

A GST-ready, AI-assisted CRM built end-to-end by Niranjan Enterprises Digital Solutions, proven daily on our own leads, quotations, invoices and clients — and the same engineering team that can build one for you.

Leads → Deals → Invoices → Payments

India GST built in (CGST/SGST/IGST)

AI lead scoring & reply drafting

Client self-service portal

Live in production since June 2026

We had the same mess our prospects have.

Leads in WhatsApp, quotations in Word, invoices in Excel, GST math done by hand, and no single place to see a client's whole relationship with us. So we built the system we wished we had — then kept using it, every day, on real money and real clients.

Before

- ✔ Leads tracked in spreadsheets and chat threads
- ✔ GST split (CGST/SGST/IGST) calculated manually per invoice
- ✔ No shared view of a client across sales, support, and accounts
- ✔ Follow-ups missed because nothing reminded anyone
- ✔ Clients calling to ask "where's my invoice / ticket status"

After

- One pipeline: Lead → Deal → Quotation → GST Invoice → Payment
- Tax auto-splits by the client's GSTIN state code — zero manual math
- Every client's deals, invoices, tickets and projects on one screen
- Automatic reminders: overdue tasks, stagnant leads, invoices due, follow-ups
- Clients self-serve via a branded portal — fewer "status update" calls

Two products, one proof point.

This deck supports two different conversations. Lead with whichever matches what the prospect actually needs — you can pivot between them mid-call.

Angle A — "We build custom software"

For prospects who need something built for their specific process (not just a CRM). Use this CRM as **proof of capability**: it's a real, production system — not a demo — handling money, tax law, and a live customer base. Pitch: *"This is the level of system our Software Development team can build for your business."*

Best for: businesses with a workflow that off-the-shelf software doesn't fit — trading, manufacturing, services, healthcare, education.

Angle B — "License this CRM for your business"

For prospects who just need a CRM + GST billing + support desk and don't want a from-scratch build. Pitch: *"Take the same system we run our own agency on, configured for your services and branding."* Faster to close, faster to deploy — the hard engineering is already done.

Best for: small/mid Indian businesses — agencies, service providers, B2B sellers — outgrowing spreadsheets and WhatsApp-only workflows.

PRODUCT TOUR

Everything a service business needs, in one system.

Nine modules, all connected — a lead in one screen is the same record as the invoice, ticket, and project in every other screen.

Leads & Pipeline

Capture from web forms, WhatsApp or manual entry. Visual pipeline: New → Contacted → Proposal → Negotiation → Won/Lost. AI scores every lead 0–100.

Quotations & Invoices

Line-item quotes with per-item GST, milestone/partial billing, one-click convert to invoice. Auto GST split, sequential legal numbering.

Payments & Recurring Billing

Partial payments against any invoice. Recurring retainers (SEO/GMB/AMC) auto-generate and auto-remind — the core of subscription revenue.

Projects & Tasks

Won deals become projects with assignees, due dates and status. Multi-person teams with Lead/Member roles per project.

Support Tickets

Priority, SLA timers, assignment. Ingests tickets from the web portal **and WhatsApp** automatically.

Client Portal

Read-only branded portal — clients see invoices, quotations, projects, ticket status and raise their own tickets. Fewer status-check calls.

Attendance & HR

Self check-in/out, biometric device sync, daily reports, employee performance reporting — one system for delivery *and* team ops.

Role Dashboards & Reports

Purpose-built dashboards per role (admin, sales, accounts, support, manager) plus revenue and performance reports, sliced by service line.

Built for how India actually invoices.

Most generic CRMs treat GST as an afterthought. This one was designed around it from day one — because we had to get it right for our own invoices first.

Automatic, correct, every time

- **Same state (Maharashtra):** auto-splits CGST + SGST, half each
- **Different state:** auto-applies IGST at full rate
- **Overseas clients:** zero-rated "Export of Services" invoice, no tax
- GSTIN validated against the official 15-character format before it's saved
- Editable tax rate per line item (default 18%, not locked)

What the invoice looks like

- Both parties' GSTIN shown, HSN/SAC code per line
- Full tax breakup table + amount in words
- Legal numbering: NEDS/2026-27/0042 — financial year + sequence
- Bank details, UPI ID and a branded PDF, emailed automatically
- Draft invoices stay invisible to the client until accounts hits "Send"

AI that helps the team, never replaces their judgment.

Powered by Anthropic's Claude. Every AI feature is optional, fails silently if it's down, and never sends anything without a human clicking Send.

Lead scoring

Every new or updated lead is scored 0–100 automatically with a one-line reason, so sales prioritises the right calls first.

Draft replies

One click drafts a reply to a lead or ticket using the full interaction history. The human always edits and sends — AI never auto-sends.

Thread summaries

Summarize a long client or ticket history into a few lines before a call — no more scrolling months of notes.

Talking point for prospects

"AI is switched on with one toggle and off by default — you're never locked into it, and it never runs a workflow unsupervised. That's a deliberate design choice, not a limitation."

BEYOND THE CRM

It's the hub of a connected agency stack.

For agency prospects specifically: this CRM already talks to a service delivery cockpit and an AI content production tool — proof we can integrate systems, not just build them standalone.

THE BORING STUFF THAT MATTERS

Enterprise habits, small-business budget.

Prospects who've been burned by a cheap CRM before will ask about this. Have the answers ready.

Concern	How it's handled
Account takeover	Two-factor authentication (authenticator app) enforced for admins and managers; optional for all roles.
Who did what	Every create/update/delete on core records is logged — who, when, and exactly which fields changed — visible in an admin audit log.
Role-appropriate access	Every action is checked against a policy per role (admin/manager/sales/support/accounts/intern) — not just hidden menus.
Data loss	Automated nightly database backups (14 days rolling + 8 weeks archive), monitored by email alert on failure.
Does it actually get used	Attendance can sync from a physical biometric device — proof the system is wired into daily operations, not shelfware.
Is it tested	400+ automated tests cover GST math, invoice numbering, permissions, and every core workflow before any change ships.

PROOF, NOT A PROMISE

This isn't a prototype. It's what we run our agency on.

Every number below is our own production system, today.

Live

since June 2026, in daily use

10+

internal staff across sales, support, accounts &
management, using it every day

3

connected systems (CRM + Drishti + SMDost)
integrated end-to-end

400+

automated tests protecting GST math, billing &
permissions

"We migrated 65 real clients from spreadsheets in one afternoon. Since then every quotation, GST invoice and support ticket for our own agency has gone through this system — not a demo environment."

No servers to hire someone to babysit.

A deliberate technical choice, and a genuine selling point for price-sensitive Indian SMB prospects.

What it runs on

- Standard shared web hosting (~₹5,000–15,000/year class of hosting) — **no** dedicated server, Docker, or DevOps hire required
- No Redis, no message queue infrastructure, no websocket server to maintain
- Standard MySQL database — any hosting provider, any competent developer can support it later

Why prospects should care

- Dramatically lower running cost than a custom app built on "modern" infra (Kubernetes, managed queues, etc.)
- No lock-in to us for hosting — it's plain PHP/MySQL, portable to any host
- Predictable monthly cost — no surprise cloud bills that scale with traffic

WHO TO PITCH THIS TO

Ideal customer profile.

Good fit

- ✓ Indian SMB or agency with 5–50 staff
- ✓ Mix of recurring retainer revenue and project/milestone billing
- ✓ Currently on spreadsheets, WhatsApp, and/or a generic CRM that doesn't handle GST
- ✓ Has a support/ticket load from clients (agency, IT services, B2B vendor)
- ✓ Wants a client-facing portal without building one from scratch
- ✓ Values owning their data/source over a per-seat SaaS subscription forever

Poor fit — don't force it

- Needs true real-time features (live chat, collaborative editing) — this stack polls, it doesn't push
- Wants a native mobile app on day one
- Enterprise scale (500+ concurrent users) — shared hosting won't hold that; needs a different infra conversation
- Wants a marketplace of 200 pre-built integrations — this is a focused system, not a platform

ENGAGEMENT MODELS — FRAMEWORK ONLY

How to package the offer.

Pricing is not filled in below on purpose — confirm current numbers with management before quoting. This is the structure to quote against, not a rate card.

Model	What's included	Typical structure
License this CRM Angle B	This exact system, deployed on the client's own hosting, branded for them, configured with their services/GST/roles.	One-time setup fee + monthly support/hosting retainer. Fastest to deliver.
Custom build Angle A	A new system built to the client's exact workflow — this CRM's codebase as the proven starting point/foundation, not a copy-paste.	Scoped project quote (discovery → milestones), like any other NEDS Software Development engagement.
Ongoing support	Bug fixes, small feature requests, backups, uptime monitoring — for either model above.	Monthly retainer, tiered by response-time SLA.

QUICK REFERENCE FOR THE CALL

Objection handling.

They say...	You say...
"We already use [Zoho/Salesforce/etc.]"	"Does it split GST automatically by GSTIN state code, or does your accounts team still do that by hand? That's usually the gap."
"How do we know it'll actually get finished / supported?"	"It's not a pitch — it's the system running our own agency's invoicing right now. You can ask to see it live."
"Isn't custom software expensive to maintain?"	"It runs on standard shared hosting and plain MySQL — no Kubernetes bill, no DevOps hire. That's a deliberate cost choice."
"We're worried about AI making mistakes with client data."	"AI is off by default, opt-in, and never sends anything without a human clicking Send. It never touches money or contracts."
"What if we outgrow it?"	"It's your data and your source code on your hosting — no seat-based lock-in. We can also scope a bigger custom build off this same foundation."

NEXT STEPS

Show, don't just tell.

The strongest close is a live demo of a real, running system — not a slide. Walk the prospect through their own scenario: a lead coming in, a GST quotation, an invoice, a support ticket. Let them see it work.

Before every pitch

- Confirm which angle fits (build-for-you vs. license-this)
- Have a demo login ready — never share the live production login
- Know their state (Maharashtra vs. inter-state) to demo the right GST split
