

CRM training video scripts

These are **recording scripts**, not the training videos themselves — nobody has recorded anything yet. Each file below is a scene-by-scene guide (what to click, what to say) so whoever records can do it in one sitting without prep work or a written outline of their own.

Why scripts instead of finished videos

With a 10-person team, producing polished edited videos is a lot of effort for not much payoff. A script you read while screen-recording gets you real training video, fast, without needing editing skills — and it stays easy to re-record whenever a workflow changes, since you just re-read the updated section instead of re-editing footage.

How to record

1. **Tool:** [Loom](#) (free tier is fine, one-click screen + webcam + mic) or OBS Studio if you'd rather save the file locally first. No editing needed — Loom uploads and gives you a shareable link immediately.

1. **Log in as a real (or test) user** with the right role before you start, and have some realistic data ready to click through (an existing lead, client, invoice, etc. — see each script's "Before you record" checklist).

1. **Read each SAY line naturally** — it's a script, not a word-for-word transcript requirement. Paraphrase in your own words if that feels more natural; the point is to hit the same points in the same order.

1. **Don't stop and restart for small mistakes.** If you fumble a click, just say "let me try that again," redo it, and keep rolling — viewers skip through small stumbles fine, and it saves you from re-recording the whole thing.

1. **One take per script is the goal.** These are sized to be recordable in a single sitting (see the target length at the top of each file).

1. When done, drop the Loom link in the relevant training doc (or wherever your team keeps shared links) so new hires can find it alongside the written guide.

Which script for which role

Script	Who watches it	Target length
getting-started.md	Everyone , first video watched	~9 min
sales.md	Sales	~15 min
support.md	Support	~11 min
accounts.md	Accounts	~15 min
manager.md	Manager	~18 min
admin.md	Admin	~13 min
intern.md	Intern	~6 min
client-portal.md	Clients — shared as an onboarding video after portal invite, not watched by staff	~7 min

Everyone watches [getting-started.md](#) first, then the one script matching their role. Managers/admins may also want to skim the Sales/Support/Accounts scripts since they oversee those modules, but it's not required.

[client-portal.md](#) is a different kind of script from the rest — it's for **clients**, not staff, so its "SAY" lines speak directly to the client ("you") the way [docs/user-guides/client-portal.md](#) already does. Record it once as a generic onboarding video (using a demo/test client account) and share the same recording with every new client, rather than per-client.

On the longer scripts (Sales, Accounts, Manager, now 15-18 min): these grew a lot again in the 2026-07-25 refresh (Team Nudges, Notice Board, Sales Incentive, Staff Productivity Ranking, Google Meet Notes, and more — see each script's git history for the full list) on top of the 2026-07-19 refresh before it. Still recordable in one sitting if you're comfortable with a longer take, but each of the three now names its own natural split point right in the header (e.g. Sales splits after Scene 9, Manager after Scene 8) — two clean videos beat one long one with a lot of restarts. If a future refresh pushes these even longer, that's the signal to actually split the file into two scripts rather than just noting a split point.

PDF handouts

For sharing with the team (not everyone wants to read raw Markdown on GitHub), each script also has a PDF version in [pdf/](#). Regenerate all of them after any edit:

...

```
npm run training-pdfs
```

...

Needs Node + a Chromium-based browser (Chrome or Edge) installed; override with [CHROME_BIN=/path/to/chrome](#) if it isn't auto-detected. Reuses the

same Markdown→PDF pipeline as the `docs/user-guides` handouts.

Keeping these in sync

These scripts mirror `docs/user-guides/*.md` structure closely on purpose — if a guide changes (a new feature ships, a workflow changes), check whether the matching training script needs the same update. They don't need to move in lockstep automatically — outdated video is a minor inconvenience, not a correctness problem, but try not to let them drift for more than a release or two.
